FIXBIN.EXE filename.ext loadaddress data

Fixbin allows you to replace data at "loadaddress" with the data specified in "data". The file can be any file, including ascii, but you have to know the load address for your data.
eg. fixbin test.bin 12ac 01ff02fe03fd04fc05fb06fa07ee08
Opens file test.bin if it exists and seeks byte number 12ac(hex). Replaces what is there with the binary data, "01ff02fe03fd04fc05fb06fa07ee08". It displays the replaced data as well as the replacing data.
The syntax must be specified exactly as above, where the load-address is in ascii-hex and separates the filename and the data with a single space between each. The data is also ascii-hex and may not have a space separating bytes.
